

# The Domsday Report

from Uni. of Texas (2006)

## **By Treason & Treachery:**

This may be the first and last time you see these matters in open discussion at University level. If it frightens you good, you know you are alive so don't waste your opportunity to help save yourself.

For easy understanding it should be read as an addendum to other literature on this site. It is unlikely that Professor Pianka intended to do humankind any favours but it is by opposition mistakes that we can gain useful help for a logical understanding of world events.

We should note the confidence of the speaker that his audience would not be panicked at the thoughts expressed. He has full confidence that his indoctrinated audience has faith in its evolutionary beliefs and accepts that life has no meaning or purpose, therefore premature destruction of nine out of ten of their number will not distress them. Indeed, as you will see, those few who opposed his views gave the possibility of student groups forming to aid this end as a reason for opposing him.

Also note that the small opposition to his forecast is not challenging accuracy. In fact, with understanding, we can see that the aim of those resisting is to achieve a more moderate consensus. But for those looking honestly at our culture the question is: how can we attract a logical response from our 'drunk on the wine of deceit' population.

Those, who have a broad based understanding and a practiced use of logic can see that our drift to disaster is neither by

accident nor chance. We will also see that those who plan it have no intention of sharing the carnage.

The evidence set out is quite sufficient to confirm the development of the plan, from the old socialist/capitalist division trick to the modern formation of the peer-group cult in our schools - from the highly disciplined education of elitists of one hundred years ago to a fun 'dumbed down' commonality now deprived of human intellectual essentials.

Do you know that all the money collected in taxes in the USA does not pay the interest on their national debt? Or that, world-wide, Council, State and Federal taxation and borrowed money is still not enough to maintain roads, railways, hospitals and education in our 'prosperous' 'democracies'.

But these things cannot be explained instantaneously, we, individually, have to see that our future is important enough to make an effort to save. We have also to realize that there is an effective "World Government" operating and that it is in the vital interests of this criminal government (and of the sect behind it) that problems are promoted to their advantage. For them this is a war for possession of this earth.

Revealing how this program has been played out over the last hundred years is the theme of this literature. So read this story; then read the evidence assembled. Only when you have the wide range of evidence can you make a logical decision or choice in relation to the saving of your future.

As you read the article below remember that President Carter (for the USA in 1980) endorsed the Global 2000 plan for the elimination of two billion humans by year 2000; that is not repealed. This literature also explains why that date for completion should never have been taken seriously.

### **University Of Texas Professor Says Mass Death Is Imminent!**

Report by Jamie Mobley

The Seguin Gazette-Enterprise 4-3-6

*Quote: "AUSTIN - A University of Texas professor says the Earth would be better off with 90 percent of the human population dead.*

*"Every one of you who gets to survive has to bury nine," Eric Pianka cautioned students and guests at St. Edward's University on Friday. Pianka's words are part of what he calls his "doomsday talk" - a 45-minute presentation outlining humanity's ecological misdeeds and Pianka's predictions about how nature, or perhaps humans themselves, will exterminate all but a fraction of civilization.*

*Though his statements are admittedly bold, he's not without abundant advocates. But what may set this biologist apart from other doomsday soothsayers is this: Humanity's collapse is a notion he embraces.*

*Indeed, his words deal, very literally, on a life-and-death scale, yet he smiles and jokes candidly throughout the lecture. Disseminating a message many would call morbid, Pianka's warnings are centered upon awareness rather than fear.*

*"This is really an exciting time," he said amid warnings of apocalypse, destruction*

*and disease. Only minutes earlier he declared, "Death: this is what awaits us all. Death." Reflecting on the so-called Ancient Chinese Curse, "May you live in interesting times"!*

[Well yes; the ending of an era has to be an interesting time; an exciting time. But for those who hope to be among the survivors, it also has to be a serious time - a time of trial stimulation and effort. We do certainly have time for a smile and a joke but those of human potential want to see many more than ten percent survive because we do not struggle to win by deceit and destruction of the majority; we win by enlightenment and reform.

So what's at the heart of Pianka's claim? "6.5 billion humans is too many; we've grown fat, apathetic and miserable and leaving the planet parched."

Well we don't argue with that; but that was not by democratic planning, that was by the planning of a tiny minority who plan to step out of the way and survive with a servant class remanent.]

#### **What is "The Pianka solution?"**

A 90 percent reduction.

*That's 5.8 billion lives - lives he says are turning the planet into "fat, human biomass." He points to an 85 percent swell in the population during the last 25 years and insists civilization is on the brink of its downfall - likely at the hand of widespread disease.*

[Disease] "... will control the scourge of humanity," Pianka said. "We're looking forward to a huge collapse." Well so much for plan to look foreword to. But don't tell local "citizen scientist" Forrest Mims to

quietly swallow Pianka's call to awareness. Mims says it's an "abhorrent death wish" and contends he has "no choice but to take a stand."

Mims attended the educator's doomsday presentation at the Texas Academy of Science's annual meeting March 2-4. There, the organization honored Pianka as its 2006 Distinguished Texas Scientist - another issue Mims vocally opposes.

"This guy is a loose cannon to believe that worldwide genocide is the only answer," said Mims, who filed two formal petitions with the academy following the meeting.

Joining the crusade, James Pitts, who received a Ph.D. in physics from UT-Austin, became the second to publicly chastise Pianka when he filed a complaint Saturday with the UT board of regents. He insists a state university is no place to disseminate such views.

He writes: "Pianka's message does not fall within the realm of his professional competence as a biologist, because it is a normative claim, not a descriptive one."

Pianka is encouraged to use his ecological expertise to predict the likely consequences of certain technological and reproductive strategies, but to evaluate some as good, bad, or worthy of prevention by genocide is the realm of philosophy or political science, not science. His message falls no more within his professional competence than it would for a physicist to teach religion in class or a musician to encourage racism. Â"

But Pianka, a 38-year UT educator, maintains he's not campaigning for genocide. He likens mankind's story to an

unbridled party on a luxury cruise liner. The fun's going strong on the upper deck, he says. But as crowds blindly absorb the festivities, many fail to notice the ship is sinking.

"The biggest enemy we face is anthropocentrism," he said, describing the belief system in which humans are the central element of the universe. "This is that common attitude that everything on this Earth was put here for [human] use." To Pianka, a human life is no more valuable than any other - a lizard, a bison, a rhino. And as humans reproduce, the demand for resources like food, water and energy becomes more than the Earth can sustain, he says."

[Well we don't need to argue about that but we do need to understand is that this ship is not sinking because humanity thinks it is the central purpose of the creation, it is sinking because humanity has been led to party on by deceivers and drugs pushers who expect to grab the lifeboats when its too late to save the ship.]

"Ken Wilkins, a Baylor University biology professor and associate dean, agrees the inevitability of a crashing point is unarguable. "The human population is growing," he said. "We will see a point when we reach the carrying capacity - there aren't enough resources."

But resources aren't the only threat, Pianka says. It's the Ebola virus he deems most capable of wide scale decimation. "Humans are so dense (in population) that they constitute a perfect substrate for an epidemic". He contends Ebola is merely an evolutionary step away from escaping the confines of Africa. And should an outbreak

occur, Pianka assuredly says humanity will quickly come to a "grinding halt."

The professor's not the only one who can articulate this concept. Because Pianka includes his doomsday material in his coursework, Ebola and its potential play a notable role in some students' studies. A syllabus for one course reads:

"Although [Ebola Zaire] Kills 9 out of 10 people, outbreaks have so far been unable to become epidemics because they are currently spread only by direct physical contact with infected blood.

However, a closely-related virus that kills monkeys, Ebola Reston, is airborne, and it is only a matter of time until Ebola Zaire evolves the capacity to be airborne."

It is here that some say Pianka ventures from provocative food for thought to, as Wilkins said, "very extreme material" that violate many people's views - including his own - about the treatment of human life.

While many praise Pianka's boldness and scientific know-how, others say he crosses an ethical line in his treatment of Ebola's viability as a killer.

In an evaluation of Pianka's course - performed anonymously in keeping with university policy - one student offered: "Though I agree that conservation biology is of utmost importance to the world, I do not think that preaching that 90 percent of the human population should die of Ebola is the most effective means of encouraging conservation awareness."

Mims says he's seen countless doomsday predictions come and go. But Pianka's is different, Mims said. Pianka, he insists, exhibits genuine cause for alarm. Mims

worries fertile young minds with a thirst for knowledge [and indoctrinated with humanism] may develop into enthusiastic supporters of a deadly disease, advocating the fall of humanity.

"He recommended airborne Ebola as an ideal killing virus," Mims said. "He showed slides of the Four Horsemen of the apocalypse and human skulls. He joked about requiring universal sterilization. It reminded me of a futuristic science fiction movie with a crazed scientist planning the death of humanity."

But as confident as Mims is in his assessment, he faces one unarguable fact: Most of Pianka's former students are bursting with praise. Their in-class evaluations celebrate his ideas with words like "the most incredible class I ever had" and "Pianka is a GOD!"

Mims counters their ovation with the story of a Texas Lutheran University student who attended the Academy of Science lecture. Brenna McConnell, a biology senior, said she and others in the audience "had not thought seriously about overpopulation issues and a feasible solution prior to the meeting." But though McConnell arrived at the event with little to say on the issue, she returned to Seguin with a new outlook.

An entry to her online blog captures her initial response to what's become a new conviction: "[Pianka is] a radical thinker, that one!" she wrote. "I mean, he's basically advocating for the death for all but 10 percent of the current population. And at the risk of sounding just as radical, I think he's right." Today, she maintains the Earth is in dire straits. And though she's decided Ebola isn't the answer, she's still

considering other deadly viruses that might take its place in the equation. "Maybe I just see the virus as inevitable because it's the easiest answer to this problem of overpopulation," she said.

Though listeners like McConnell may walk away with a deadly message, Pianka maintains this is inconsistent with his lecture. One UT official said Pianka is likely well within his rights as a tenured educator.

The 1940 Statement of Principles on Academic Freedom and Tenure - a set of guidelines recognized nationwide - guarantees college professors vast classroom liberties. But Neal Armstrong, vice provost for faculty affairs at UT, said even this freedom is not without limits.

"Faculty members have the right of free speech like anyone else," he said. "In the classroom, they're free to express their views.

There is the expectation, though, that in public - especially when speaking on controversial topics - they must make every effort to be clear that they are not speaking on behalf of the university." Students should be able to discern on their own the validity of views like Pianka's, Armstrong said. But if allegations of Pianka actively advocating human death were to be confirmed, he said "there might be some discussion about the appropriateness of that subject." "I would hope that's not what's intended," he said. "I don't think that's appropriate for the classroom, but that's my personal statement."

Robert K. Jansen, chair of the section of integrated biology under which Pianka is

classified, said his understanding of the doomsday material left no cause for concern.

"It's important for students to get all opinions, and they have to do that on a daily basis," he said. To hold a classroom's attention, Jansen says educators must often "speak their mind" in a fashion bold enough to garner a bit of shock.

The Texas Academy of Science uses a similar approach in defending its decision to honor Pianka with the Distinguished Scientist award. Though TAS offered no direct comment to the Gazette-Enterprise, an email sent from TAS President David Marsh to Mims in response to Mims first letter of protest reads: "We select the DTS speaker based on his/her academic credentials and contributions to science. We do not mandate the subject he/she decides to address, nor will we ever. I would suggest that one of the purposes of any such presentation is to stimulate discussion - which indeed it did."

In his petitions, Mims inquires about the group's stance on Pianka's talk, asking if the recent honor should be interpreted as an endorsement by TAS. Marsh responded firmly, saying the award does not represent any formal backing of Pianka's ideas.

But despite the academy's flat denial of any wrongdoing, Mims maintains his stance. He said thus far, he's seen no response to the second petition. "I completely agree with one assertion made several times by Dr. Pianka: 'The public is not ready to hear that he hopes 90 percent of them will be exterminated by disease'". McConnell said the TAS audience, unlike Mims, was in awe of Pianka's words. They offered a

standing ovation, and enthusiastically applauded Pianka's position, Mims said.

"There was a good deal of shock and just plain astonishment at what he had to say," the student said. "Not many folk come out and talk about the end of the human population in as candid of a manner as he did. Dr. Pianka received a standing ovation at the end of his talk, if that says anything. What he had to say was radical, no question about it, but that is not to say that at least some of what he had to say is not true."

Though Pianka turned down requests for a sit-down interview, he maintains he is not advocating human death.

Does he believe nature will bring about this promised devastation? Or is humanity's own dissemination of a deadly virus the only answer? And more importantly, is this the motive behind his talks? Responding to these very questions, Pianka said, "Good terrorists would be taking [Ebola Roaston and Ebola Zaire] so that they had microbes they could let loose on the Earth that would kill 90 percent of people."

As of press time, Pitts - who sent his appeal via email Saturday - had received no response from the university, but he says, "It's too early for any responses to have been made." Meanwhile, Pianka urges humanity to heed his call to be prepared, saying "we're going to be hunters and gatherers again real soon." "This is gonna happen in your lifetime," he told his St. Edward's audience. "Do you wanna go there? We've already gone there. We waited too long." End quotes.

\* \* \*

**Well that's a really interesting interpretation of what is happening and**

**we should take it seriously because it is a serious attempt by a present day educator to understand and fix a very serious reality. We added emphasis to the above but it needs more.**

**This radical speaker had support for his interpretation and it was not unrealistic. That it did not stir greater distress was probably because many did not take it seriously; they should have – it's a little sad, the cancer in our culture is widespread! Are now beginning to see our situation?**

You KNOW those who misled are not honest caring people! You KNOW our world is drifting into a pit of pain and suffering! Why is search for more oil to create more pollution, allowed? What do you think will happen if/when, in a world saturated with hate and armaments, increase of erratic global weather cuts food production by half?

Can Globalist planning be completed with the advent of Global Warming? **Who dares read the following, and more on this site?**

**U.N. Global Warming report. [Click here for recent U.N. release!](#)**
